TEACHING AND RESEARCH INTERESTS

Primary Fields: Macroeconomics, Monetary Economics

Secondary Fields: International Macroeconomics, Financial Economics

RESEARCH EXPERIENCE AND OTHER EMPLOYMENT

Research Assistant, Prof. Christoph Boehm

Fall 2018; Fall 2019; Fall 2020

Ph.D. Trainee, European Central Bank

Summer 2019

TEACHING EXPERIENCE

University of Texas at Austin

Macroeconomic Theory, Prof. Olivier Coibion

Fall 2021

Macroeconomics II (Ph.D.), Prof. Saroj Bhattarai

Spring 2020; Spring 2021

Macroeconomic Theory, Prof. Christoph Boehm

Fall 2017; Spring 2019

Macroeconomic Theory, Prof. Andrew Glover

Spring 2018

Financial Economics, Prof. Patrick Van Horn

Summer 2017

Introduction to Macroeconomics, Prof. Shalah Mostashari

Spring 2017

Introduction to Microeconomics, Prof. Wayne Hickenbottom

Fall 2016

HONORS, SCHOLARSHIPS, AND FELLOWSHIPS

Referee: Review of Economics and Statistics (5x)

Service: Student Seminar Coordinator, University of Texas at Austin

WORKING PAPERS

Firm-Level Uncertainty and the Transmission of Forward Guidance to Investment

2021, *Job Market Paper*

I study the role of firms' uncertainty in the transmission of forward guidance to investment. To do so, I employ a quarterly firm-level panel of U.S. publicly traded firms. I measure forward guidance shocks based on unexpected changes in the slope of the yield curve in a 30-minute window around Federal Reserve announcements. I show that firms which are more uncertain adjust their investment as if they are more pessimistic. Put differently, more uncertain firms adjust their investment relatively more downward for expected monetary tightenings, and relatively less upward for expected loosening. To explain my empirical findings, I construct a medium-scale New Keynesian model with two sectors, a high-uncertainty and low-uncertainty one. Agents in the high-uncertainty sector are ambiguous (Knightian uncertain) about the informativeness of forward guidance, and choose to take a pessimistic stance due to their ambiguity aversion. The model implies that expansionary forward guidance is less powerful in recessions due to a larger share of uncertain agents.

The US, Economic News, and the Global Financial Cycle

2020, with Christoph E. Boehm, *Review of Economic Studies*

We provide evidence for a causal link between the US economy and the global financial cycle. Using intraday data, we show that US macroeconomic news releases have large and significant effects on global risky asset prices. Stock price indexes of 27 countries, the VIX, and commodity prices all jump instantaneously upon news releases. The responses of stock indexes co-move across countries and are large—often comparable in size to the response of the S&P 500. Further, US macroeconomic news frequently explains more than 15% of the quarterly variation in foreign stock markets. The joint behavior of stock prices and long-term bond yields suggests that systematic US monetary policy reactions to news do not drive the estimated effects. Instead, the evidence is consistent with a direct effect on investors' risk-taking capacity. Our findings show that a byproduct of the United States' central position in the global financial system is that news about its business cycle has large effects on global financial conditions.

Beyond the Yield Curve: Understanding the Effect of FOMC Announcements on the Stock Market

2021, with Christoph E. Boehm

A large literature uses high-frequency changes in interest rates around FOMC announcements to study monetary policy. These yield changes have puzzlingly low explanatory power for the stock market—even in a narrow 30-minute window. We propose a new approach to test whether the unexplained variation represents monetary policy news or just noise. In particular, we allow for a latent “Fed non-yield curve shock”, which we estimate via a heteroskedasticity-based procedure. Using a test for weak identification, we show that our shock is well identified, that is, the unexplained variation is not just noise. We then go on to show that the shock, signed to increase stock prices, leads to sizable declines in the equity and variance premium, an increase in the 10-year term premium, an increase in short-run inflation expectations, as well as a dollar depreciation against multiple non-safe-haven currencies. Hence, the evidence supports the interpretation that the shock affects risk-appetite and leads to a reverse “flight-to-safety” effect. Lastly, using a method from the computational linguistics literature, we show that our shock can be linked to specific topics discussed in FOMC statements, suggesting that it reflects written communication by the Federal Reserve.
